UNDERSTANDING e-HEALTH AND WHY WE NEED IT.

"To improve care you have to measure it. Information management is care" (Don Berwick)

- •Clinical computing 1976-2011.
- •Current/Future data demands on CDM
- •Technology of clinical computing
 - •. Storage, interoperability and standards, forms, data capture, CPOE.
- •Translocating health information technologies MMRS-AMPATH-OpenMRS.
- •Effective CDS tools (MSAccess) show how HIT and CDS works.
- •Meeting the needs of scalability.
- •Role of the internet, WWW, m-Health to meet the demands of modern health care. [VIDEOS]

Some Definitions.

Information is not a necessary adjunct to care, <u>it is care</u>, and effective patient management requires effective management of patients' clinical data.

Donald M. Berwick President and CEO, Institute for Healthcare Improvement

There is no health without management, and there is no management without information. *WHO-Gonzalo Vecina Neto, head of the Brazilian National Health Regulatory Agency*

Information is <u>necessary</u> to provide and manage health care <u>at all</u> <u>levels</u>, from individual patients to health care systems to national Ministries of Health (MOH). *W.Tierney. Dir. Regenstrief Institute*.

So what is eHealth? <u>The World Health Organization (WHO) definition:</u> "e-Health is the combined use of electronic communication and information technology in the health sector."

Health Informaticians.

"Informaticians should understand that our first contribution is to see healthcare as a complex system, full of information flows and feedback loops, and we also should understand that our role is to help others ''see' the system, and re-conceive it in new ways."

E. Coiera. April 2009, Centre for Health Informatics, Institute of Health Innovation, University of New South Wales, Australia

Functions of Clinical Informaticians

- Clinical informaticians use their knowledge of patient care combined with their understanding of informatics concepts, methods, and tools to:
- Assess information and knowledge needs of health care professionals and patients;
- Characterize, evaluate, and refine clinical processes;
- Develop, implement, and refine clinical decision support systems;
- Lead or participate in the procurement, customization, development, implementation, management, evaluation, and continuous improvement of clinical information systems.

Goals of Computerized Clinical Decision Support Systems (for EMR)

International Journal of Medical Informatics 54 (1999) 183–196 The CCC system in two teaching hospitals: a progress report. Warner V. Slack Howard L. Bleich

1.Information:

captured directly at computer terminals located at the point of each transaction, not on pieces of paper.

- 2. <u>Information</u> captured at a terminal or automated device: anywhere in the hospital should be available immediately, if needed, at any other terminal.
- 3. The <u>response time</u> of the computer should be rapid-blink times.
- 4. The computer should be <u>reliable and accurate</u>.
- 5. <u>Confidentiality</u> should be protected.

6.The <u>computer programs should be friendly to the user and reinforce</u> <u>the user's behavior</u>.

7. There should be a <u>common registry</u> for all patients.

<u>Goals of implementation.</u>

- 1. Eliminate logistic problems of paper recordclinical data timely, reliable, complete.
- 2. Reduce the work of clinical bookeeping-no more missed Dx, or forgotten preventive care.
- 3. Information 'gold' within medical records available to clinical, epidemiological, outcomes and management research.

The Regenstrief Medical Record System. IJMI 54 (1999) 225-253

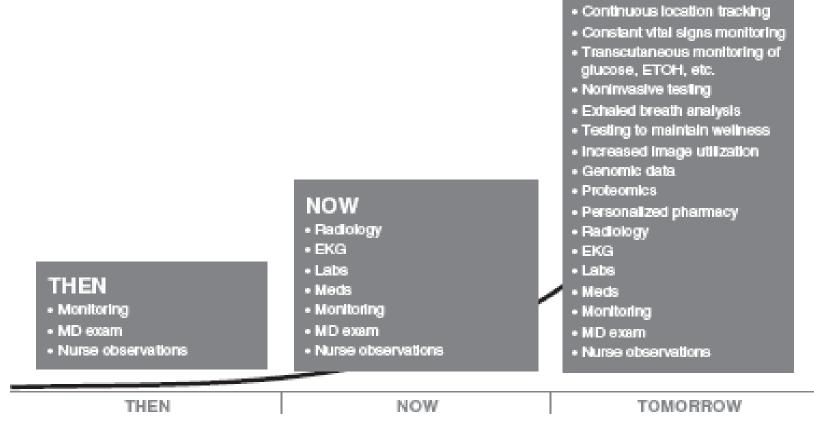

Four key functions of electronic clinical decision support systems

"Administrative": Supporting clinical coding and documentation, authorization of procedures, and referrals. "Managing clinical complexity and details": Keeping patients on research and chemotherapy protocols tracking orders, referrals follow-up, and preventive care. "Cost control': Monitoring medication orders; avoiding duplicate or unnecessary tests. "Decision support": Supporting clinical diagnosis and treatment plan processes; promoting use of best practices, condition-specific guidelines, population-based management.

http://www.openclinical.org/dss.html

What can technology do NOW!

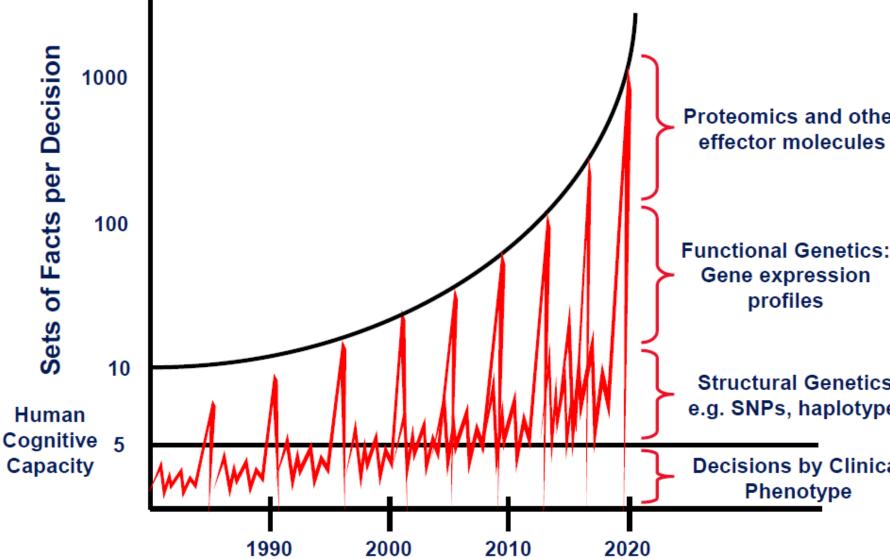

The Regenstrief Medical Record System. IJMI 54 (1999) **Retrieval times-Fast (blink times) Data and information-Comprehensive Data storage- Long-term-lifelong Data applications-Introspective of total database** Data storage-**200 million coded observations 3.25 million narrative reports 15 million prescriptions** 212,000 ECG tracings More than 1.3 million patients Access-**1300** medical nurses **1000 physicians 220 medical students Across health care institutions (16)** Data access more than 628,000 / month

	Total cost	\$675	\$895	\$1024

After Hours Resource Utilisation - 1998/99 (PRH0s-UK.)

87% Unnecessary out-of-hours tests
80% Diagnostic uncertainty
79% Medico-legal protection
66% Avoid leaving work for colleagues
71% Prevent criticism from staff (especially Consultants)
76% Lessen anxiety and reduce stress levels
71% Agreed attempts should be made to reduce unnecessary testing

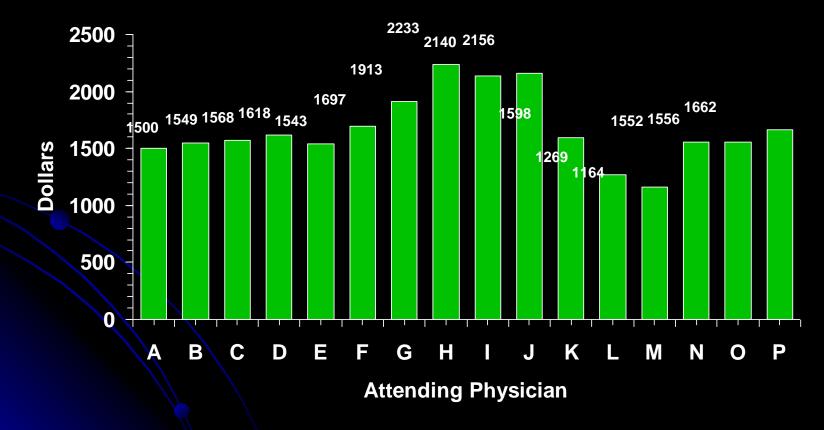

<u>McConnell AA</u>, <u>Bowie P</u>. Health Bull (Edinb). 2002 Jan;60(1):40-3. Unnecessary out-of-hours biochemistry investigations--a subjective view of necessity.

THE VARIATION PHENOMENON

"The variation phenomenon in modern medicine -the observation of differences in the way apparently similar patients are treated from one health care setting to another." *D. Blumenthal. Editorial NEJM 331:1994;1017-8*

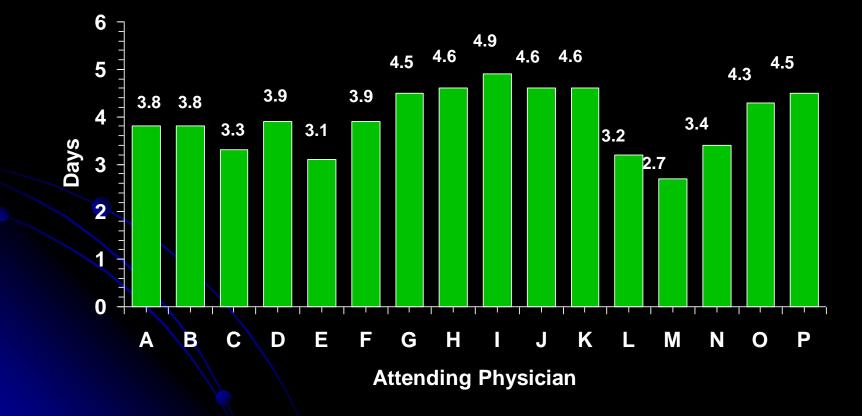

IHC TURP QUE Study-COST VARIATION

Average Hospital Cost

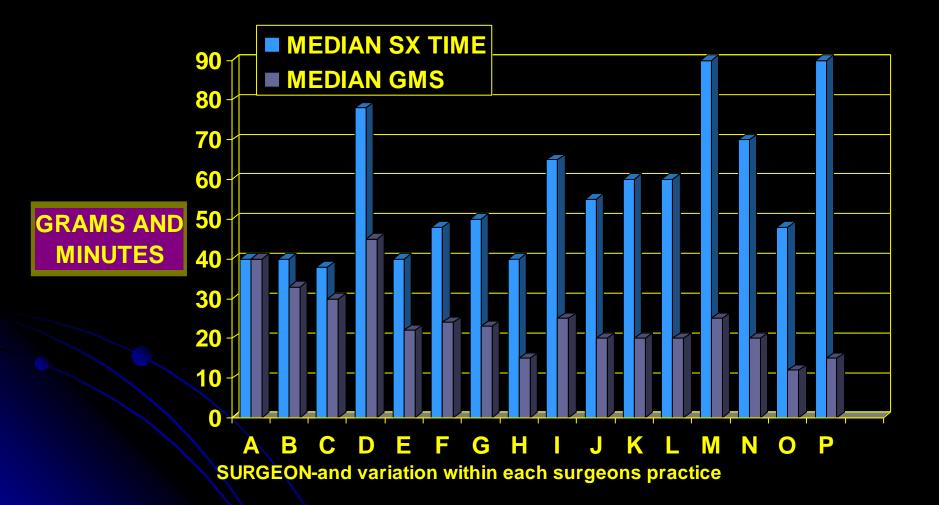

IHC TURP QUE Study-Average LOS variation

Average Length of Stay

IHC TURP QUE Study-Grams excised vs. Time variation

Reasons for practice variation

♦ Complexity

- How many factors can the human mind simultaneously balance to optimize an outcome? -- Alan Morris, MD
- "The complexity of modern American medicine exceeds the capacity of the unaided human mind" -- David Eddy, MD

\Lack of valid clinical knowledge (poor evidence)

Subjective judgment / uncertainty

- Subjective evaluation is notoriously poor across groups or over time
- Enthusiam for unproven methods -- Mark Chassin, MD

Human error
 -- humans are inherently fallible
 information processors
 -- Clem MacDonald, PhD

SMALL AREA VARIATIONS IN HEALTH CARE DELIVERY

SERVICE	REIMBURSEMENT VARIATION
XRAYS	400 %
ECG	600 %
LAB SERVICES	700%

Wennberg J. Gittelsohn A. Science;1973;182:1102-8

Variation over time-has it improved?

Per capita Medicare spending varies considerably from region to region. The effect of greater Medicare spending on quality of care and access is not known.

Using end-of-life care spending as an indicator of Medicare spending
Geographic regions into five quintiles of spending and examined costs and outcomes of care for;

hip fracture

colorectal cancer

•acute myocardial infarction.

Outcomes:

Residents of high-spending regions received 60% more care but did not have better quality or outcomes of care.

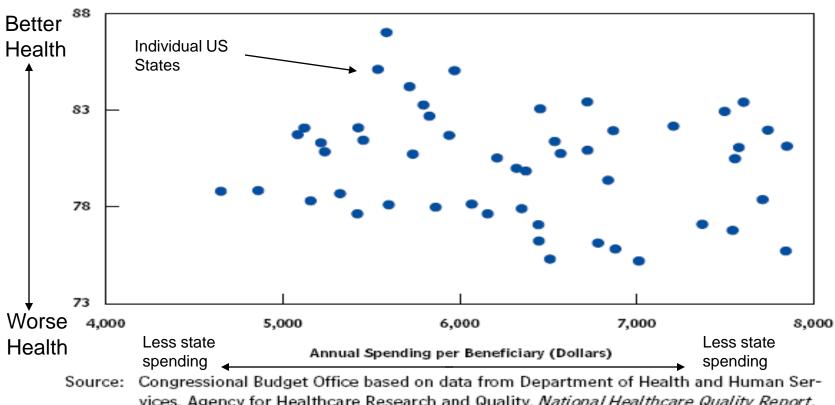

Implications: Medicare beneficiaries who live in higher Medicare spending regions do not necessarily get better-quality care than those in lower-spending regions. *—The Editors*

The Implications of Regional Variations in Medicare Spending. Part 1: The Content, Quality, and Accessibility of Care. Elliott S. Fisher, MD, MPH; David E. Wennberg, MD, MPH; The' re' se A. Stukel, PhD; Daniel J. Gottlieb, MS; F.L. Lucas, PhD; and ' Etoile L. Pinder, MS. *Ann Intern Med.* 2003;138:273-287.

Figure 3.

The Relationship Between Medicare Spending and Quality of Care, by State, 2004

(Composite measure of quality of care)

vices, Agency for Healthcare Research and Quality, *National Healthcare Quality Report, 2005* (December 2005), Data Tables Appendix, available at www.ahrq.gov/qual/nhqr05/ index.html, and data from the Centers for Medicare and Medicaid Services' Continuous Medicare History Sample.

Notes: The composite measure of the quality of care, based on Medicare beneficiaries in the fee-for-service program who were hospitalized in 2004, conveys the percentage who received recommended care for myocardial infarction, heart failure, or pneumonia.

Spending figures convey average amounts by state.

GEOGRAPHIC VARIATIONS IN PHARMACY SPENDING

•~20% Medicare spending

•Varies substantially among hospital-referral regions

- Highest-spending region spending 60% more per beneficiary on pharmaceuticals than the lowest.
- Variation in both drugs prescribed and number of prescriptions/month
- Physicians in higher-spending areas more drugs and more expensive drugs.

Medical spending varies more across hospital-referral regions than drug spending.

Geographic Variation in the Quality of Prescribing. Yuting Zhang, et.al. N Engl J Med 2010; 363:1985-1988<u>November 18, 2010</u>

Variation 2008

The wide variation in medical prices within U.S. markets that creates an opportunity for transparency to reduce spending. This variation exists even for relatively common procedures.

New Hampshire-2008

Average payment for arthroscopic knee surgery - \$2,406 with a standard deviation of \$1,203 in hospital settings and \$2,120 with a standard deviation of \$1,358 in nonhospital settings.

Tu HA, Lauer JR. Impact of health care price transparency on price variation: the New Hampshire experience. Issue brief no. 128. Washington, DC: Center for Studying Health System Change, 2009.

Massachusetts-Median hospital cost in 2006 and 2007 for magnetic resonance imaging (MRI) of the lumbar spine, performed without contrast material, ranged from \$450 to \$1,675.2

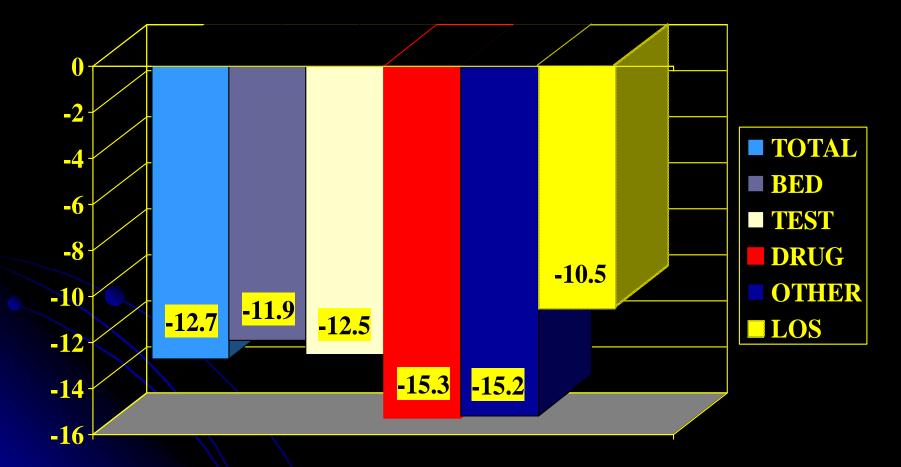

Massachusetts Division of Healthcare Finance and Policy. Measuring healthcare quality and cost in Massachusetts. (http://www.mass.gov/Eeohhs2/docs/dhcfp/r/pubs/09/measuring_hc_quality_cost_mass_nov-09.pdf.)

Cause and effect of potential causes of ADEs.(From L.Grandia. IHC, Utah-with permission)

Cause and effect of potential causes of ADEs.(From L.Grandia. IHC, Utah-with permission)

Computerized surveillance of adverse drug events in hospital patients

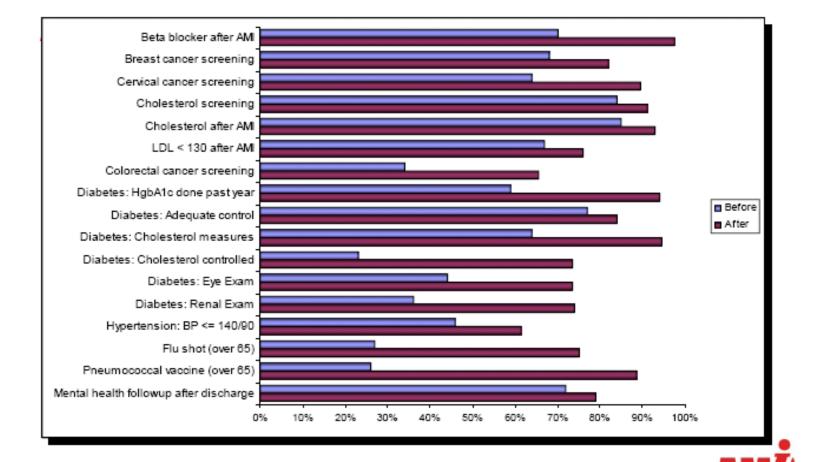

Classen DC, Pestotnik SL, Evans RS, Burke JP. JAMA 1991;266:2847-2851.

ADVERSE EVENTS -IDENTIFICATION AND PREVENTION

"Most hospitals rely on spontaneous voluntary reporting to identify adverse events, but this method <u>overlooks</u> <u>more than 90%</u> of adverse events detected by other methods.....<u>Retrospective chart review</u> improves the rate of adverse event detection but is <u>expensive and</u> <u>does not facilitate prevention</u>."

Potential identifiability and preventability of adverse events using information systems. D Bates et.al J Am Med Informatics Assoc. 1994;1:404-411

VA's Success with Decision Support

Intermountain Health Care, Salt Lake City, Utah, USA

STUDY DESIGN

- Computer-based EMR system
- Patients discharged January 1, 1988 to December 31, 1994
- 162,196 patients
- Goal: to determine clinical and financial outcomes of the
- antibiotic practice guidelines implemented through the
- computer system

Pestotnik, S. L. Classen, D. C. Evans, R. S. Burke, J. P. Implementing antibiotic practice guidelines through computer-assisted decision support: clinical and financial outcomes. Ann Intern Med 1996 May 15

Intermountain Health Care, Salt Lake City, Utah, USA

Overall antibiotic use:	decreased 22.8%
Mortality rates:	decreased from 3.65% to 2.65%
Antibiotic-associated ADE:	decreased 30%
Antibiotic resistance:	remained STABLE
Appropriately timed preoperative a/biotics:	40% to 99.1%
Antibiotic costs per treated patient:	decreased \$122.66 to \$51.90
Acquisition costs for antibiotics:	fell 24.8% to 12.9%
	(\$987,547) to (\$612,500)

Our case-mix index which measures patient acuity levels <u>INCREASED</u> during this period, meaning we were treating sicker and sicker patients while better utilizing the delivery of antibiotics.

Pestotnik, S. L. Classen, D. C. Evans, R. S. Burke, J. P. Implementing antibiotic practice guidelines through computer-assisted decision support: clinical and financial outcomes.Ann Intern Med 1996 May 15 <u>Amarasingham</u> found impressive relationships between the presence of several technologies and complication and mortality rates and lower costs.

The specific technologies evaluated included order entry, clinical decision support, and automated notes.

<u>Higher order entry scores</u> were associated with 9% and 55% decreases in mortality rate for patients with myocardial infarction and coronary artery bypass surgery, respectively.

The results for decision support were impressive: higher decision support scores were associated with;

• 21% decrease in the risk of complications.

•Perhaps of most interest from the informatics perspective was the impact of automated notes, which were associated with a 15% decrease in the risk of fatal hospitalizations among all causes.

1. Bates DW. ARCH INTERN MED/VOL 169 (NO. 2), JAN 26, 2009 Editorial

2. Amarasingham R, Plantinga L, Diener-West M, Gaskin DJ, Powe NR. Clinical information technologies and inpatient outcomes: a multiple hospital study. *Arch Intern Med.* 2009;169(2):108-114.

Not all HIT are beneficial.

There were also some instances in which relationships in the opposite direction were found; for example, electronic documentation was associated with a 35% increase in the risk of complications in patients with heart failure, though this may have been present because it was easier to find these events since better documentation

was present.

1. Bates DW. ARCH INTERN MED/VOL 169 (NO. 2), JAN 26, 2009 Editorial

2. Amarasingham R, Plantinga L, Diener-West M, Gaskin DJ, Powe NR. Clinical information technologies and inpatient outcomes: a multiple hospital study. *Arch Intern Med.* 2009;169(2):108-114.

Questions.

1. Are the technologies—computer order entry, decision support, and clinical documentation—sufficiently mature that hospitals should be adopting them now? Bates: the answer is a clear yes for large hospitals. For smaller hospitals, which use a different set of vendors, the answer is less clear, but studies are currently under way that should provide additional information regarding this.

2. For clinical documentation, the benefits are still only beginning to be determined and are likely to be spread across a wide range of areas, but this will likely prove to be beneficial as well.
Bates DW. REPRINTED) ARCH INTERN MED/VOL 169 (NO. 2), JAN 26, 2009
WWW.ARCHINTERNMED.COM
Amarasingham R, Plantinga L, Diener-West M, Gaskin DJ, Powe NR. Clinical information technologies and inpatient outcomes: a multiple hospital study. Arch

Intern Med. 2009;169(2):108-114.

Do the negative consequences of implementing HIT in hospitals overwhelm or wash out the positive ones?

Current evidence is that they do not overall.

EVALUATION is critical with technology after implementation and making multiple changes to it—points that are all too often ignored. Bates DW. ARCH INTERN MED/VOL 169 (NO. 2), JAN 26, 2009

Figure 2

e-Chasqui main patient page. This page shows the patient's full bacteriological history on the left sidebar and with bolded sample date for the sample whose results were being displayed on main part of page.

A web-based laboratory information system to improve quality of care of tuberculosis patients in Peru: functional requirements, implementation and usage statistics.

- March 2006-2007
- 29,944 smear microscopy
- 31,797 culture and 7,675 drug susceptibility test results have been entered.
- Over 99% of these results have been viewed online by the health centres.
- High user satisfaction
- Heavy use has led to the expansion of e-Chasqui to additional institutions.
- In total, e-Chasqui will serve a network of institutions providing medical care for over 3.1 million people.
- The cost to maintain this system is ~US\$0.53 per sample or 1% of the National Peruvian TB program's 2006 budget.

PIH-EMR Impact

- Over 12,500 records of patients who have received MDR-TB treatment in Peru
- eChasqui module showed significant reductions in delays in delivering drug sensitivity test results to physicians
- Order entry system shown to reduce errors in drug regimens
- Drug forecasting tools reduced the errors in predicting medication requirements six months in advance

WHO/Evelyn Hockstein

Clinical officers like Lillian Boit provide most patient care and maintain charts. "The electronic record-keeping system allows us to provide care to more people and take better care of patients", she says.

WHO/Evelyn Hockstein

At every monthly check-up patients are given their charts and hand-carry them to the nurse, clinical officer and other providers they are seeing that day. Updates to the chart are made at each station.

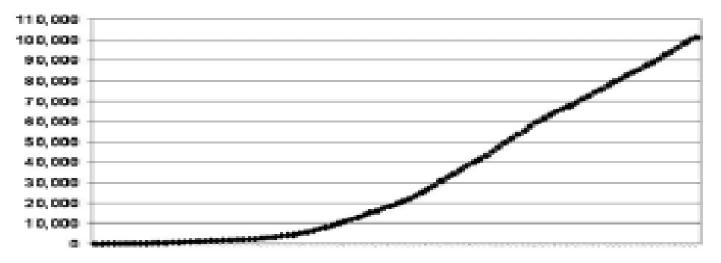

An innovative home-care programme using handheld computers is also being piloted in the region. Monica Korir, who is living with HIV and is trained as an outreach worker, interviews Paul Ekorok, 52, at his home in Captarit village and records his answers.

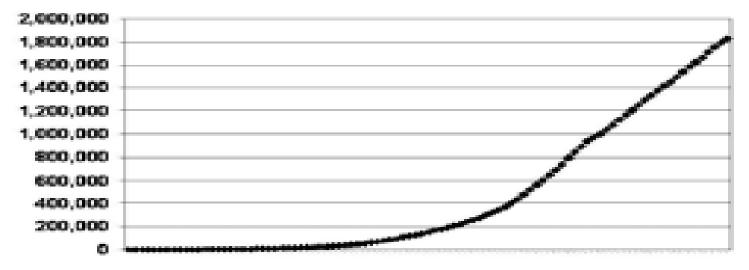

WHO/Evelyn Hockstein

Outreach workers download completed forms into Mosoriot clinic's data management system daily. Automated alerts flag any alarming new symptoms to the attention of the responsible clinical officer, or when a patient has missed an appointment so that outreach workers can find out what is wrong.

OpenMRS Western Kenya-cumulative visits 11/01-09/09

Cumulative Patients Enrolled: Nov '01 – Sept '09

Cumulative Patient Visits: Nov '01 – Sept '09

Figure 1- Cumulative patients enrolled and visit records

Besides antiretroviral drugs (which are provided by USAID), care by AMPATH cost only \$175/patient/year in 2007 and is now less than \$100/patient/year in 2009.
P. Park, et al., *Case Report: The Academic Model for the Prevention and Treatment of HIV/AIDS*. Harvard Business School, Boston, 2008.

In addition to the monthly, quarterly, and annual reports required by funding and agencies and the MOH, the AMRS also provides data to a robust multidisciplinary research program:

Researchers from more than a dozen North American universities and Moi University currently have more than 30 ongoing studies in East Africa, supported by >\$26 million in grants from U.S. federal granting agencies and various foundations.

A response to HIV

HIV is a treatable disease, but treating millions requires information management.

OpenMRS is...

- An Electronic Medical Record System-web based
- A data model
- An API
- An HIV system
- A TB system
- A Primary Care system
- A developer community
- An implementer community

... and more.

The OpenMRS Implementers Network

Christopher J. Seebregts^{a,b,*}, Burke W. Mamlin^{ed}, Paul G. Biondich^{ed}, Hamish S.F. Froger⁴, Benjamin A. Wolfe^{*}, Darius Jazayeri^{*}, Christian Allen⁴, Justin Miranda¹, Elaine Baker⁴, Nicholas Musinguz¹, Daniel Kayiwa¹, Carl Fourie^{*}, Neal Lesh¹, Andrew Kanter^{*}, Constantin T. Yiannoutsos⁴, Christopher Baile¹, ^{*}The OpenMRS Implementers Network

Clinical data collected

- The patient's clinical status
- Bacteriology results
- Drug sensitivity testing results
- The current drug regimen.
- Previous drug regimens.
- Bio-chemistry and hematology results
- Drug complications and adverse events.
- Chest x-ray (CXR) reports and digital images.
- Background data (occupation, housing, contacts)

OpenMRS Sites : Clinical & Research Sites

Implementation Time Frames and support.

It took us about 6 weeks ... to configure our ER and Surgery modules in OpenMRS. ... Thanks again to Andy at MVP and James at HAS among others for considerable guidance and support ... There are only a couple of us working on this project at MSF with limited resources, and without the help of the implementers group we would have been stopped in our tracks.

On June 1 we went live with the production database in Port au Prince. ... <u>the system is run by local staff with limited</u> <u>technical training</u>. ... Overall we have been impressed with the stability of OpenMRS on Linux; server reboots are sometimes necessary once or twice a day because of Tomcat memory errors. With three months of data in the system now and stability and output tried and true ... Thanks. John John Brooks. Médecins Sans Frontières (MSF)/Doctors Without Borders

Figure 1. Design Goals used for the AMRS

Collaboration – systems need to be developed openly and built upon a common infrastructure, the sharing of "best of breed" modules can best occur within a shared infrastructure

Scalability – the infrastructure must not only handle thousands of patients and hundreds of thousands of observations, but also be scalable to tens of thousands of patients and millions of observations

Flexibility – systems must support not only HIVcentered care, but also general medical care, since clinical care is not limited to HIV care

Rapid form design – data collection needs are a moving target; therefore, form design and deployment must allow for continual change

Clinically useful – feedback to providers and caregivers is critical – if the system is not clinically useful, it will not be used

Use of standards - to maximize the flexibility and extensibility of the system

Support high-quality research - via nonambiguous, coded data

Web-based with support for intermittent connections – developing countries do not always have reliable power or internet connections, but when available, internet-based technologies offer increased scalability

Low cost – if the system is to be widely available and adaptable in developing countries, cost must not prohibit adoption. Ideally, the nuts and bolts of the system should be downloadable for free.
